EUROCONTROL Forecast Update 2021-2024 European Flight Movements and Service Units Three Scenarios for Recovery from COVID-19

STATFOR - May 2021

The May 2021 forecast is a 4-year forecast that covers the horizon 2021-2024

The May 2021 forecast takes into account the following updated inputs:

- ✈ Traffic trends: Current traffic flows still strongly impacted by **COVID-19**.
- ✈ Economic growth: Latest revision of the economic forecast (Oxford Economics March 2021 release).
- ✈ Update of the existing three scenarios accounting for COVID-19 impact and timing of recovery.

This forecast replaces the November 2020 forecast.

Traffic Trends

There were 65% fewer flights in January-April 2021 than in the same period of 2019, between Sc2 and Sc3 of the latest forecast (Nov20)

EUROCONTROL 25%

Recent trends in flights in European airspace

Forecast assumptions Nov20	Jan-Apr 2021
Sc1. Vaccine summer 2021	-59%
Sc2. Vaccine summer 2022	-60%
Sc3. Vaccine not effective	-66%

*Growth calculated vs same day in 2019

Each line is a national airspace. Smoothing: 14 steps.

Economic Growth in Europe

The GDP baseline forecast for 2021 has been revised downward

GDP Growth (%)

Zone = Euro Area

Source: Oxford Economics, Release: March 2021

Downward revision following weakness in the early part of 2021 against a backdrop of a **slow start of the vaccination roll-out** and the **extension of public health restrictions**.

Economic Growth in Europe

Various scenarios are considered with greater or lesser long-term economic damage

Source: Oxford Economics, Release: March 2021

Rapid upturn: Longer-term economic scars are avoided as the successful roll-out of vaccine programmes and additional fiscal stimulus cement recovery.

Baseline: Output remains subdued in the early part of 2021, before accelerating from Q2 as restrictions ease.

Limited vaccine effectiveness: The global economy stagnates, accompanied by market falls.

Scenario COVID-19 recovery

We reviewed the scenarios from Nov20 forecast to consider all possible risks and their relative impacts

In updating the scenarios, we took into account the following dimensions:

- ✈ Effectiveness of vaccine against new virus variants
- ✈ Speed of deployment of vaccine amongst population, reaching herd immunity ($\pm 70\%$)
- ✈ Strength of domestic aviation markets
- ✈ Coordinated European approach facilitating a safe free movement inside EU (Digital green certificate)
- ✈ Possible differences in state aid and risks of bankruptcies in aviation industry
- ✈ Savings glut and pent-up demand effect, particularly the VFR (Visiting Friends and Relatives) market
- ✈ Reduction in demand to fly for business travellers (i.e. increased uptake of video conference,...) but also of leisure travelers (e.g. Effect of travel shaming and achievement of the global climate ambitions)
- ✈ Variation of long-haul recovery: e.g. North-Atlantic flows recovering faster

Scenario Update COVID-19 recovery

Optimistic and pessimistic scenarios are explored

Scenario 1

Vaccine Summer 2021

Easing of travel constraints as of Summer 2021

Recovery to 2019 level in 2024

From mid-2021:

Vaccine roll-out progressing within Europe and globally.
Effective test & trace programme.
Relatively good passenger confidence.
Coordinated interregional approach.
Savings glut/Pent-up demand.
Lingering hit to business travel.

Airlines, especially LCCs, reasonably well able to invest and re-hire once demand returns.

Some long-haul flows restarting quicker than others (e.g. North Atlantic, Oceania and Asia).

Scenario 2

Vaccine Summer 2022

Easing of travel constraints as of Q1 2022

Recovery to 2019 level in ~2025

From late-2021:

Vaccine roll-out reaching herd immunity levels within Europe.
Effective test & trace programme.
Relatively good passenger confidence.
Coordinated European approach.
Savings glut/Pent-up demand.
Permanent lingering hit to business travel.

Airlines, especially LCCs, reasonably well able to invest and re-hire once demand returns.

A few long-haul flows restarting quicker than others (e.g. North-Atlantic first).

Scenario 3

Lingering infection

Lingering infection and low passenger confidence

Recovery to 2019 level in ~2029

Persistent restrictions due to vaccine not effective against new and more transmissible coronavirus variants.
Patchy uptake of vaccine.

Difficult for airlines to operate as pre-COVID-19: some regions are experiencing renewed outbreak phases, not at the same time, not with the same severity.

Demand is bouncing back for 60-70% of travelers but reluctance to fly for rest (fear and/or alternatives); permanent drop in propensity to fly.

Additional Risks

The risk behind **Brexit**: We have assumed that continued transport connectivity will be ensured. Businesses and individuals operating in the UK should therefore see no change to existing conditions after the transition period.

Future **airspace and network changes** (e.g. unexpected closures, new routes) and **airlines' changing choice of routes** are not modelled by the forecast.*

The **economic recovery** remains fragile. Current forecast includes different economic forecasts (Sc1: Rapid upturn, Sc2: Baseline, Sc3: Limited Vaccine Effectiveness) but a further deterioration of the economic situation (eg financial crisis) is a downside risk.

The **volatility in oil and fuel prices**: A surge in oil prices could lead in an increase of fuel cost, hence an increase of the ticket prices which is a downside risk.

Terrorist attacks, bans of one country on another one, wars and natural disasters.

These are impossible to predict. Their impact on air traffic could however be a temporary one, or more significant.

* Overflights are calculated from routes used over the Sep19 to Aug20 period; this is more significant for individual countries than for all ECAC.
